

**IN THE CLAIMS:**

In accordance with the Revised Rules under 37 C.F.R. 1.121, please amend the claims as shown be. Also shown below are claims that may be original, cancelled, withdrawn, previously presented, new, and not entered.

Please cancel claims 1-9, and add new claims 10-18 as follows:

10. (new) A device for the remote control of an actuator and/or a sensor for the security and/or comfort and/or monitoring installation of a building, comprising a processing unit, a command transmitter, and a transfer means, the device configured to transfer to the processing unit, from the command transmitter, a processing program relating to the operation of the actuator and/or of the sensor, said processing program stored in directly executable form.

11. (new) The device according to claim 10, wherein the actuator is configured to drive a shading or closure element.

12. (new) The device according to claim 10, wherein the processing unit, a radio transmitter, and the actuator define a communication, processing and actuation unit, said radio transmitter configured to communicate in a reception mode and in a transmission mode with any radio frequency device sharing the same transmission protocol, wherein the communication, processing and actuation unit is configured to receive, store, and execute the processing program.

13. (new) The device according to claim 12, wherein the processing unit comprises a microprocessor which executes one or more programs contained in a program memory having at least one reprogrammable portion.

14. (new) The device according to claim 13, wherein a non-erasable program memory contains a storage area configured to store at least one code segment relating to the type of

hardware installed in the processing unit.

15. (new) The device according to claim 14, wherein the reprogrammable memory contains a storage area configured to store at least one code segment relating to an application.

16. (new) The device according to claim 10 wherein the command transmitter contains the executable program to be transferred, and includes a two-way transmitter, a processing and actuation unit, and a control unit, in which the program to be transferred is stored.

17. (new) A method for updating the operation of an actuator and/or a sensor controlled by at least one processing unit and intended for the security and/or the comfort and/or the monitoring of a building, the method comprising:

transmitting binary data by means of radio waves to the actuator and/or to the sensor, the binary data including

at least one code program directly executable by the processing unit of the actuator and/or of the sensor;

at least one product and/or application identification code; and  
the program and the identification code being stored in an electrically reprogrammable memory of the processing unit.

18. (new) The method according to claim 17 herein including providing the processing unit with a processing program relating to the operation of the actuator and/or of the sensor, the processing program being provided by a command transmitter and stored in a form directly executable by the processing unit .
